

Scientific naturalism is the view that our world is wholly a result of natural processes that can be explained by ordinary science, without the need to postulate intervention by a Creator. There have always been those who held this view, but with Copernicus and the rise of modern science, it came to be the common view among scientists, and was dominant by 1900. However in recent years, science has uncovered ever stronger evidence of design embedded in the very fabric of the natural universe, in the geological record of Earth's history, and in the nature of life itself. This talk summarizes the evidence that led to the rise of scientific naturalism, and how discoveries of science have challenged that view in recent years and decades.
